AB A process for distillative working up mixts. containing (meth)acrylic acid and/or (meth)acrylic ester in a column for distilling,

rectifying and/or fractionally condensing, involves the presence of at least one polymerization inhibitor and an oxygen-containing gas, wherein the partial

oxygen pressure p(O2) in the gas phase of the entire column is from 2 to 5 hPa.

19951122

RO 1995-2017

RO 1995-2017

with alkylene oxides using Fe and Cr catalysts comprises degassing of the product under stirring and 350-500 mm Hg pressure, followed by decantation, and distillation in 2-5 steps in the presence of 0.1-1% 4-methyl-2,6-ditertbutylphenol polymerization inhibitor, and 5-7% poly(alkylene glycol) added to the first stage. The order of decantation and degassing operations can be reversed. The degassing operation ensure removal of unreacted to alkylene oxides to levels at or below 0.5% and decantation removes insol. catalysts as sludge at levels of 1.5-3% of bulk product. The mol. weight of poly(alkylene glycol) used in the distillation process

is 200-600. In an autoclave reactor a mixture of 1600 g methacrylic acid, 3,7 g. phenothiazine, 11.6 g anhydrous FeCl3, and 11.6 g CrO3 was heated to 75° under N and 892 g ethylene oxide slurry were added in a period of 2 h, then the reaction was allowed to proceed for 1 h. raw product, cooled to ambient temperature contained 1.6% ethylene oxide and esterification was 99.7%. The reactor pressure was adjusted to 450 mm Hg and the product mixture was degassed by stirring for 30 min, obtained a degassed product containing 0.16% ethylene oxide and 95.22% hydroxyethyl methacrylate. The product was paced in a decantation vessel and kept at ambient pressure and temperature for 4 h; the upper layer was removed obtaining 2389 g of product containing 96.35% hydroxyethyl methacrylate (98.84% yield) and 57 g slurry remained in the bottom layer. The inhibitor, 21 g., and 25 g poly(ethylene glycol) were added to the product and distillation in 5 steps

was carried out; the final product yield was 2255 g distillate containing 98.02% hydroxyethyl methacrylate.

AB Aqueous acrylic acid solns. obtained by gas-phase catalytic oxidation of propylene and/or acrolein with mol. O-containing gases are purified in processes containing azeotropic dehydration-distillation, where alkanolamines

and

polymerization inhibitors are added to the solns. Thus, a 55% aqueous acrylic acid solution (containing 200 ppm phenothiazine and 50 ppm p-methoxyphenol) obtained by 2-step catalytic oxidation of propylene was azeotropically distilled with PhMe, further distilled, and mixed with 200 ppm monoethanolamine and 25 ppm Cu dibutyldithiocarbamate to give a sample showing polymer formation rate 163 ppm/h at 100°, vs. 4436 ppm/h for a control not containing the additives.

AB A process for distillative working up mixts. containing (meth)acrylic acid and/or (meth)acrylic ester in a column for distilling, rectifying and/or fractionally condensing, involves the presence of at least one polymerization inhibitor and an oxygen-containing gas, wherein the partial

oxygen pressure p(O2) in the gas phase of the entire column is from $2 \cdot to 5$ hPa.
